Pseudocode

“Executable” at an abstract level.

Stackable Permutations

Definition (Stackable Permutations)

$$\text{out} = (a_1, \dots, a_n) \leftarrow \frac{S = \emptyset}{X = \perp} \text{in} = (1, \dots, n)$$

We can assume that X is always blank.

$\text{read} + \text{push}$ $\text{read} + \text{print}$
 $\text{pop} + \text{print}$ $\text{pop} + \text{push}$

Definition (Stackable Permutations)

$$\text{out} = (a_1, \dots, a_n) \xleftarrow{S = \emptyset} \text{in} = (1, \dots, n)$$

DH 2.12: Stackable Permutations

(a) Show that the following permutations *are* stackable:

- (i) (3, 2, 1)
- (ii) (3, 4, 2, 1)
- (iii) (3, 5, 7, 6, 8, 4, 9, 2, 10, 1)

DH 2.13: Stackable Permutations Checking Algorithm

To check whether a given permutation can be obtained by a stack.

```
1: procedure STACKABLE(out)
2:   for all  $a_j \in out$  do
3:     while  $top(S) \neq a_j$  do
4:       Push(in, S)
5:       Pop(out, S)
```

Q : What is wrong with STACKABLE?

DH 2.13: Stackable Permutations Checking Algorithm

To check whether a given permutation can be obtained by a stack.

```
1: procedure STACKABLE(out)
2:   for all  $a_j \in out$  do
3:     while  $top(S) \neq a_j \wedge in \neq \emptyset$  do
4:       Push(in, S)
5:     if  $top(S) = a_j$  then
6:       Pop(out, S)
7:     else  $\triangleright top(S) \neq a_j \wedge in = \emptyset$ 
8:       return F
9:   return T
```

DH 2.12: Stackable Permutations

(b) **Prove** that the following permutations are *not* stackable:

(i) $(3, 1, 2)$

(ii) $(4, 5, 3, 7, 2, 1, 6)$

$(3, 1, 2)$

$(4, 5, 3, 7, 2, 1, 6)$

$\text{out} = \cdots a_i \cdots a_j \cdots a_k : i < j < k \wedge a_j < a_k < a_i$

312-Pattern

Theorem (Stackable Permutations)

A permutation (a_1, \dots, a_n) is stackable \iff it is not the case that

$$312\text{-Pattern} : \boxed{out = \dots a_i \dots a_j \dots a_k : i < j < k \wedge a_j < a_k < a_i}$$

Proof.

stackable $\implies \nexists$ 312-Pattern

\nexists 312-Pattern \implies stackable

312-Pattern \implies non-stackable

\exists algorithm

Theorem (Stackable Permutations)

A permutation (a_1, \dots, a_n) is stackable \iff it is not the case that

312-Pattern : $out = \dots a_i \dots a_j \dots a_k : i < j < k \wedge a_j < a_k < a_i$

312-Pattern \implies non-stackable.

$i < j \wedge a_j < a_i$:	Push _j	Push _i	Pop _i	Pop _j
$j < k \wedge a_j < a_k$:	Push _j	Pop _j	Push _k	Pop _k
$i < k \wedge a_k < a_i$:	Push _k	Push _i	Pop _i	Pop _k

Theorem (Stackable Permutations)

A permutation (a_1, \dots, a_n) is stackable \iff it is not the case that

312-Pattern : $out = \dots a_i \dots a_j \dots a_k : i < j < k \wedge a_j < a_k < a_i$

\nexists 312-Pattern \implies Obtainable by STACKABLE.

STACKABLE fails $\implies \exists$ 312-Pattern.

```
1: procedure STACKABLE(out)
2:   for all  $a_j \in out$  do
3:     while  $top(S) \neq a_j \wedge in \neq \emptyset$  do
4:       Push( $in, S$ )
5:     if  $top(S) = a_j$  then
6:       Pop( $out, S$ )
7:     else  $\triangleright top(S) \neq a_j \wedge in = \emptyset$ 
8:       return  $F$ 
9:   return  $T$ 
```

$a_j \neq top(S) \wedge in = \emptyset$

a_j is covered by some a_k in S

$\exists k : j < k \wedge a_j < a_k$

Why is a_k in S ?

$\exists i : i < j \wedge a_k < a_i$

DH 2.12: Stackable Permutations

(c) How many permutations of A_4 *cannot* be obtained by a stack?

$(1, 4, 2, 3), (2, 4, 1, 3), (3, 1, 2, 4), (3, 1, 4, 2), (3, 4, 1, 2)$
 $(4, 1, 2, 3), (4, 1, 3, 2), (4, 2, 1, 3), (4, 2, 3, 1), (4, 3, 1, 2)$

Q : What about A_n ?

DH 2.12: Stackable Permutations

How many permutations of $\{1 \cdots n\}$ are stackable?

Q : How many *admissible* operation sequences of “Push” and “Pop”?

Definition (Admissible Operation Sequences)

An operation sequence of “Push” and “Pop” is *admissible* if and only if

- (i) # of “Push” = n # of “Pop” = n
- (ii) \forall prefix : (# of “Pop”) \leq (# of “Push”)

of admissible operation sequences = # of stackable perms

$$\{\text{admissible operation sequences}\} \xrightarrow{\exists f:1-1} \{\text{stackable perms}\}$$

$f(s) \triangleq$ *Execute* this admissible operation sequence s

Why is f bijective (1-1)?

Theorem

The number of admissible operation sequences of “*Push*” and “*Pop*” is $\binom{2n}{n} - \binom{2n}{n-1}$.

Proof: The Reflection Method.

Push : \rightarrow Pop : \uparrow

$$\underbrace{\binom{2n}{n}}_{\text{all}} - \underbrace{\binom{2n}{n-1}}_{\text{inadmissible}}$$

$$\binom{2n}{n} - \binom{2n}{n-1}$$

Catalan Number

$$(3, 2, 1) : ((())) \quad (1, 2, 3) : ()()()$$

Queueable Permutations

DH 2.14: Queueable Permutations

$$\text{out} = (a_1, \dots, a_n) \xleftarrow[\text{X} = \perp]{\text{Q} = \emptyset} \text{in} = (1, \dots, n)$$

DH 2.14: Queueable Permutations

(b) Prove that every permutation are **queueable**.

```
1: procedure QUEUEABLE(out)
2:   for all  $a \in in$  do
3:     read( $X$ )
4:     add( $X, Q$ )
5:   for all  $a \in out$  do
6:     while  $Head(Q) \neq a$  do
7:       remove( $X, Q$ )
8:       add( $X, Q$ )
9:     remove( $X, Q$ )
10:    print( $X$ )
```

DH 2.14: Queueable Permutations

(c) Prove that every permutation can be obtained by **two stacks**.

```
1: procedure DOUBLESTACKABLE(out)
2:   for all  $a \in in$  do
3:      $read(X)$ 
4:      $push(X, S)$ 
5:   for all  $a \in out$  do
6:     while  $top(S) \neq a$  do
7:        $pop(X, S)$ 
8:        $push(X, S')$ 
9:      $pop(X, S)$ 
10:     $print(X)$ 
11:    while  $S' \neq \emptyset$  do
12:       $pop(X, S')$ 
13:       $push(X, S)$ 
```

All are queueable.

Only one is queueable.

3 2 1 is not queueable

Theorem (Queueable Permutations)

A permutation (a_1, \dots, a_n) is *queueable* \iff it is not the case that

321-Pattern : $\boxed{out = \dots a_i \dots a_j \dots a_k : i < j < k \wedge a_i > a_j > a_k}$

Proof.

Now, it's **your** turn.

Theorem (# of Queueable Permutations)

The number of queueable permutations of $[1 \cdots n]$ is $\binom{2n}{n} - \binom{2n}{n-1}$.

Proof.

Now, it's **your** turn.
